# North Carolina Estuaries

# NC Estuarine Wetlands

*Juncus roemerianus*  
*Distichlis spicata*

*S. patens*  
*Salicornia virginica*

*Spartina alterniflora*

- In NC, estuarine tidal range varies between 20 cm and 100 cm, increasing N to S
- Wind tides can significantly extend marsh distribution

# Southeastern Estuarine Wetland Coverage

Coastal development

*Phragmites australis*

# Wetland Management and Restoration Efforts

- From 2006 to 2015, more than 5,000 acres of estuarine wetlands have been restored in North Carolina, funded directly by Federal agencies.
- This restoration does not include mitigation-driven restoration efforts or state or local-funded restoration.
- Many of the funded projects are living shoreline projects, completed by groups such as the NCCF and TNC.

# Oyster Management and Restoration Efforts

- From 2006 to 2015, more than 175 acres of oyster reefs have been restored in North Carolina, funded directly by Federal agencies.
- This restoration does not include mitigation-driven restoration efforts or state or local-funded restoration.
- Funded projects include subtidal sanctuaries and living shoreline projects, completed by groups such as the NCCF and TNC.

# Research Needs

- Long-term performance of restoration approaches and effectiveness in sustaining ecosystem services over time
- Testing of alternative materials to enhance restoration efforts
- Resilience of extant and restored habitats to storm events, sea level rise, and other environmental stressors
- Applicability of restoration techniques used in NC to other regions
